ABSTRACT

Disaster management can be considered as a critical measurement of the ability of communities to effectively protect their people and infrastructure and rapidly recover from the disaster. In the Disaster management context, managing Humanitarian logistics plays a critical role. Where Humanitarian logistics is dealing with planning, implementing and controlling the efficient, cost effective flow of goods, materials and information from the point of origin to the point of consumption with the intention of alleviating the suffering of victims. But still most of humanitarian aids organizations lack the resources to analyze disaster related data and effectively manage logistics and rescue victims in a disaster. For any kind of disaster relief operations last mile is considered to be very critical place in humanitarian logistics management because it is the place where humanitarian aids distribution to victims is happening. When considering about global disaster context, floods can be considered as one of the most common and frequent natural disaster world population are faced. Therefore objective of this study is to analyze the applicability of last mile humanitarian logistics optimization for natural flood disasters and provide future research directions for last mile humanitarian logistics management operations in order to provide better service to victims of flood disasters and improve the performance of last mile operations.

Key words: Disasters, Humanitarian logistics management, last mile distribution, Optimization, Performance measures.

INTRODUCTION

According to the definition of International Federation of Red Cross and Red Crescent Societies, “A disaster is a sudden, calamitous event that seriously disrupts the functioning of a community or society and causes human, material, and economic or environmental losses that exceed the community’s or society’s ability to cope using its own resources. Though often caused by nature, disasters can have human origins”. In general, disasters can be categorized in to two namely natural disasters (Cyclones, tornadoes, hurricanes, landslides, earthquakes, tsunamis, volcanic eruptions, and floods) and manmade disasters (war, terrorist attacks and so on). Irrespective of the type of the disaster, Disasters can be considered as a critical measurement of the ability of communities to effectively protect their people and infrastructure and rapidly recover from the disaster. When we are going back to past few years, we experienced many natural disasters worldwide and these disasters raised demand for Humanitarian logistics management in order to alleviating suffering of the victims of the particular disaster. Where “Humanitarian logistics is dealing with planning, implementing and controlling the efficient, cost effective flow of goods, materials and information from the point of origin to the point of consumption with the intention of alleviating the suffering of victims. The humanitarian logistics management function encompasses a range of activities, including preparedness, planning, procurement, transport, warehousing, tracking and tracing, customs and clearance” (Thomas, 2004). In Humanitarian logistics management process or any Humanitarian supply chain, last mile plays very critical role irrespective of the type or nature of the disaster. Because, if a last mile of any supply chain becomes a bottleneck, it affects the performance and main objectives of whole humanitarian supply chain. More
importantly, if last mile operations become a bottleneck the victims will suffer and there can be an increase in the casualties due to the disaster.

When considering about global context, Flooding is the most common environmental hazard worldwide. This is due to the vast geographical distribution of river floodplains and low-lying coastal areas. It is difficult to define exactly a flood is. It is largely classified as ‘an overflowing of water onto normally dry land [Natural Disasters Association]. A flood occurs when water overflows or inundates land that's normally dry. This can happen in a multitude of ways. Most common is when rivers or streams overflow their banks. Excessive rain, a ruptured dam or levee, rapid ice melting in the mountains, or even an unfortunately placed beaver dam can overwhelm a river and send it spreading over the adjacent land, called a floodplain. Coastal flooding occurs when a large storm or tsunami causes the sea to surge inland. A 2007 report by the Organization for Economic Cooperation and Development found that coastal flooding alone does some $3 trillion in damage worldwide. Therefore, when considering about the global context floods can be considered as one of the most frequent disasters in the world wide which made a huge impact on the functioning of normal life of the affected people.

Therefore, the main objective of this article review and peer reviewed literature is investigating to identify, what have been done in order to optimize humanitarian supply chain and especially to optimize last mile operations, identify pitfalls of them and Gaps in last mile humanitarian operation management. Finally this study provides, summarized view of last mile humanitarian operation optimization for future researches.

METHODOLOGY

Inclusion and exclusion criteria

The inclusion criteria for the studies included in this review were as follows: (1) the domain of the article was related to humanitarian logistics management and disaster management; (2) the primary focus of the article was to understand the type of disasters and difference between humanitarian supply chain and commercial supply chain; (3) the article was published in a peer-reviewed journal; (4) the article detailed the methodology of the study reported; and (5) the article was available in English. Articles were excluded if their content is not align with Optimization, Performance measure and key decision areas in order to improve performance of humanitarian supply chain.

Search strategy

For Article searching purpose mainly Emerald insight and Science direct online journal databases were used. Searching is done using following phases: (1) Disasters (2) Disaster management (3) Humanitarian logistics management (4) Last mile operations (5) Optimization (6) Performance measures in humanitarian supply chain. In this review, consider articles that focus on Optimization, Performance measure in a humanitarian supply chain and key decision areas in order to improve performance of humanitarian supply chain. Finally 14 articles were selected for the review.

Results

From the 14 selected articles, 10 were focused to whole humanitarian supply chain and other 4 focused on especially last mile operations of humanitarian supply chain. Additional to aforementioned scope 6 articles were discussing about optimization of humanitarian supply chain, another 6 were discussing about performance measure and 5 articles were discussing
key decisions area related to humanitarian logistics management process. Table 1 will demonstrate the above categorization of articles and Table 2 given below will summarize key findings/Results of 14 articles reviewed.

DISCUSSION

After reviewing content of above mentioned 14 articles in related to Optimization, performance measure and key decision area affects the performance of humanitarian logistics management process. Reviewer can observe that many optimization related studies are only focusing on disaster responding and preparedness stage even through disaster life cycle has disaster mitigation, preparedness, response and reconstruction stages. When considering about the performance improvements of humanitarian supply chain LN Van Wassenhove discussed the role of Operational research in performance improvements of humanitarian supply chain and provide directions (which are mentioned below) for Operational Research for archive performance objective of humanitarian supply chain.

- Supply chain design and management (processes)(donor issues, last mile problems, cross learning possibilities with the private sector, the military and humanitarians)
- Systems and technology (Disaster Management Information Systems, Knowledge Management, Communities of Practice)
- Project management (life cycle issues)
- Risk management (risk analysis, vulnerability assessment mapping, and supply chain robustness issues)
- Coordination and strategic alliances (partnering) (between humanitarian organizations, with industry, with the media)
- Performance measurement and scorecards (reporting, accountability and continual improvement)
- Process standardization and control (tools and behavior (eg TQM, Six Sigma, training)

Not only Operational research but also Information technology and modern technologies have a greater potential in optimizing and improving performance of a humanitarian logistics management process. A study conducted by Howden in 2009 discusses about potential of Information technology in making effective and efficient humanitarian operations in a disaster situation. Therefore, using information system in humanitarian aid operations can yield following benefits.

- Enhance needs assessments by ensuring that field staff knows what supplies are available for beneficiaries, either in local warehouses, pre-positioned emergency stocks or from local and international markets.
- Share lists of supplies available in both local and international markets, including prices and lead times, logisticians to empower program staff to better plan their procurement activities.
- Keep program staff informed of procurement activities will help to develop an understanding of the constraints within logistics and create trust.
- Provide budget holder more accurate financial information regarding funds which are committed within the procurement process, to avoid the over or under spending of budgets.
- Provide warehouse inventory reports to program staff to allow them to take more responsibility for their supplies, and ensure that they are utilized effectively.
- Share information on the distribution of supplies to allow program staff to better monitor and evaluate activities and avoid the need for duplicate record keeping between logistics and programs.
- More accurately divide logistics overhead costs such as warehouse rental, transportation and logistics staff wages into program budgets according to the activities logistics is supporting.

Balcik et.al’s study discusses about abilities of intelligent transportation systems in optimizing last mile distribution. Such as, vehicle status monitoring ability, Transportation infrastructure networking, ability to effectively plan supply allocation and so on.
According to the above analysis and study conducted by LN Van Wassenhove, there are lack of studies related to last mile humanitarian operations related to optimization, performance measure and performance improvement decision making even though last mile plays critical role in humanitarian logistics management process irrespective of the nature of the disaster. As discussed above if a last mile of any supply chain becomes a bottleneck, it affects the performance and main objectives of whole humanitarian supply chain. More importantly, if last mile operations becomes a bottleneck victims will suffer and there can be an increase in the suffering and casualties due to the disaster.

According to the world natural disaster statistics floods are considered to be the most frequent natural disaster that worldwide population is facing. Therefore, when considering the natural disaster related humanitarian logistics management, there is a raising demand for conducting researches in order to address last mile humanitarian logistics management process especially considering the natural flood situations.

When optimizing last mile humanitarian logistics management operation in a flood situation can be done by addressing following research questions.

- How to conduct last mile demand and supply management in a flood respond situation?
- How to conduct a most accurate need assessment for disaster location?
- What factors are needed to optimize?
- What performance measures are required to provide better service to the affected victims?

When finding answers to above mentioned Research questions as similar to humanitarian supply chain, Operational research, Information technology and other modern technologies related researches can be utilized for last mile humanitarian operations. As mention in above needs assessment is a very critical and difficult task in humanitarian logistic management process. In order to address this question, future researcher can introduce the needs packaging system in order to serve the victims better.

CONCLUSION

Last mile of any humanitarian supply chain plays a very critical role in providing better service for victims of particular disaster situation. If a last mile of any supply chain becomes a bottleneck, it affects the performance and main objectives of the whole humanitarian supply chain. More importantly, if last mile operations becomes a bottleneck, victims will suffer and there can be an increase in the suffering and casualties due to the disaster. According to the analysis of above mentioned 14 articles we can observe that Operational research, Information technology and other modern technologies related to researches can be effectively utilized to improve the performance of last mile humanitarian operations and optimize them.
