CONVERTING WASTE POLYETHYLENE TEREPHTHALATE  
(PET) PRODUCTS INTO UNSATURATED POLYESTER (UP)  
COMPOSITES

## ABSTRACT

How to handle the plastic waste is a big task for the modern society in environmental protection. People already focus on it, especially in PET soft drink bottles. Polyethylene terephthalate (PET) is widely used in packaging applications due to its clarity, light and low gas permeability. However, the post consumer PET bottles are not reused by manufacturers. They are left as plastic waste causing environmental problem since they cannot be degraded by natural processes. The effective solution that has been done to solve this problem is to recycle them.

On the other hand, concrete is one of the most common materials for human beings to use in construction. Concrete has good compressive strength, but poor in flexural and tensile strength, which limits its applications. Hence, scientists have tried to improve its properties by adding the polymer instead of the cement. Compared to cement based materials, the polymer concrete is very strong material. The fast curing time of this product is another important advantage in many construction applications.

Polymer Concrete (PC) can be made by using Unsaturated Polyester (UP) resins. Currently, one widely used method is to convert high molecular weight polymer into low molecular weight molecules via chemical reactions. In this research post consumer PET bottles were depolymerized to lower molecular weight molecules by glycolysis with excess Ethylene Glycol (EG). The resulting glycolysed products were used to synthesis unsaturated polyester resins with phthalic anhydride and styrene monomer.

Polymer concrete mixture was 10% unsaturated polyester resin, 45% of oven dried gravel, 32% oven dried sand and 13% of fly ash. Methyl Ethyl Keton Peroxide (MEKP) was used as an initiator and Cobalt Octoate was used as an accelerator. All the components were mixed for a period of 3 minutes. Specimens were then transferred to a mould and allowed to cure at room temperature.

Curing of the Polymer Concrete (PC) is about 6 to 12 hours.

Average compressive strength of polymer concrete                      2.12 Nmm<sup>-2</sup>

Theoretically, the early rate of strength gain is much faster for PC than it is for cement concrete. PC gains more than 80% of its final strength in one day, while normal cement concrete achieves about 20% of its final strength in one day. However, the fast curing expected was not observed in this experiment. Therefore further research needs to be done by improving reaction conditions and additives.

List of table	ii
List of figure	iii
Abstract	iv
Paper, which was presented	vi
<b>CHAPTER 1</b>	
<b>1.0 INTRODUCTION</b>	<b>1</b>
1.1 Chemistry of PET	2
1.2 PET depolymerization technology	3
1.2.1 Methanolysis	4
1.2.2 Hydrolysis	5
1.2.3 Glycolysis	6
1.3 Types of concrete	8
1.3.1 Conventional concrete	9
1.3.2 Polymer concrete	10
1.3.2.1 Polymer impregnated concrete (PIC)	11
1.3.2.2 Polymer cement concrete (PCC)	12

1.3.2.3 Polymer concrete (PC)	13
1.3.2.3.1 Application of PC	14
1.3.2.3.2 Advantages of PC	14
1.4 Theoretical	15
1.4.1 Fillers	16
1.4.2 Unsaturated polyester resin	17
1.5 Sources of PET waste	18
1.5.1 Beverage (Soft drink) bottles	19
1.5.2 PET Films	20
1.5.3 PET Fibers	20
1.6 World market and Application of PET	21
1.7 Global PET recycling	21
1.8 Recycled plastics	27
1.8.1 Purification of PET bottle recycled	27
1.8.2 Examples of products made from PET bottles recycled	28
1.9 Testing of polymer concrete	28
1.10 Experimental data from the literature	30
1.10.1 Results of glycolysis PET	30
1.10.2 PC time and temperature behaviour	33
1.10.3 Recycled PET into hardware for the construction industry	35
1.10.3.1 Rebar chairs	35
1.10.3.2 Snap tie cones	36

## **CHAPTER 2**

<b>2.0 EXPERIMENTAL</b>	<b>38</b>
2.1 Materials	38
2.1.1 Materials in aggregate phase	38
2.1.2 Materials in binder phase	40
2.2 The reagents/chemicals and instruments used	40
2.2.1 Reagents	40
2.2.2 Instruments	42
2.3 Depolmerization procedure of glycolysis	42
2.3.1 Identification of depolymerized products	43
2.4 Preparation of unsaturated polyester (UP) composite (PC)	44
2.5 Preparation of test specimen	44
2.6 Test procedure of compressive strength	45

## **CHAPTER 3**

<b>3.0 RESULT AND DISCUSSION</b>	<b>46</b>
3.1 Result of identification of glycolysed products of PET	46
3.1.1 Interpretation of IR spectrum	46
3.1.2 Results of titration experiment	49
3.2 Result of compression test	54

3.3 Discussion	54
3.4 Conclusion	55
3.5 Suggestions for further research	55
