

**Assessment of impact of pesticides on water catchments and
groundwater in some selected areas of Sri Lanka**

by

Ambalanyaya Gamaethige Piyal Aravinna

Thesis submitted to the University of Sri Jayewardenepura for

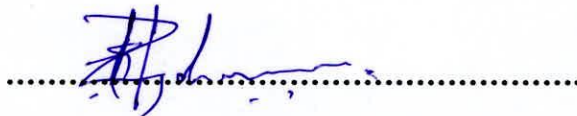

the award of the

Degree of Master of Philosophy in Chemistry on

29th September 2006

Declaration

The work described in this thesis was carried out by me under the supervision of Dr. Sudantha Liyanage, Dr. (Mrs.) Janitha A. Liyanage and Dr. A. M. Mubarak and a report on this has not been submitted in whole or in part to any university or any other institution for another Degree/Diploma.

A handwritten signature in blue ink is written over a horizontal dotted line. The signature is stylized and appears to be the name of the candidate.

39	Leakage of irrigation water from damaged tubes	150
40	Effect of irrigation on groundwater pollution potential (Kalpitiya)	151
41	Maximum residue levels of pesticides and their drinking water guidelines	154

ACKNOWLEDGEMENT

I am greatly indebted to my supervisors, Dr. A. M. Mubarak, Director, Industrial Technology Institute and Dr. (Mrs.) Janitha A. Liyanage, senior lecturer, Department of Chemistry, University of Kelaniya, Kelaniya for valuable advises, continued guidance, encouragement and criticism given me to complete this project successfully.

I would like to express my cordial thanks to Dr. Sudantha Liyanage, Department of Chemistry, University of Sri Jayewardenepura, Gangodawila, Nugegoda for taking me as his student for my academic proceedings.

I cordially thank Dr. A. M. Mubarak, Director and Mrs. Sharmini Wickramaratne, Technical manager, CML for providing me the opportunity to carry out this study at ITI. I wish to express my thanks International Atomic Energy Agency for funding the project. I wish to thank to Mr. Gamini Gunawardena, ITI for his technical assistances.

I offer my grateful thank to Dr. Rai S. Kookana and Ray L. Correll, CSIRO, Australia for their assistance to handle the PIRI model.

I wish to thank Mr. Bathika Priyantha for his assistant in field works and I wish to thank all members of ITI who participated in the accomplishment of this research study.

I thank to my dear wife for her assistance given me by helping for field work and my day to day activities during this period.

Finally I wish to thank my family members and friends for their help during this period.

**Assessment of impact of pesticides on water catchments and groundwater
in some selected areas of Sri Lanka**

Ambalanyaya Gamaethige Piyal Aravinna

ABSTRACT

Environmentalists and general community are concerned about the impact of pesticides on the environment. Systematic methods of assessment of potential risk of pesticides to environmental components can serve as valuable tools in decision-making and policy formulation. The objectives of this study were; to rank commonly used pesticides in Sri Lanka according to their pollution potential on surface and groundwater using an indicator model, field residual monitoring to measure actual risk on surface and groundwater and compare with the observed risk with prediction of indicator model.

High recharge rate due to excessive irrigation, sandy soil with low organic matter and shallow water table depth are features of the Kalpitiya area which are expected to contribute to high risk on groundwater. Some surface water reservoirs which are fed by agricultural catchments, located in the Walawe area are used as sources for public water supplies therefore the surface water pollution potential is high. Kalpitiya peninsula and Walawe area were selected for the study.

Relative risk of pesticide in terms of mobility and toxicity on surface and groundwater were assessed using an indicator model namely Pesticide Impact Rating Index. Shallow domestic wells which were located around agricultural plots of both Walawe and Kalpitiya areas and the man made reservoirs in Walawe area were monitored for commonly used pesticides. According

to PIRI prediction; out of commonly used pesticides in Kalpitiya area, Carbofuran and Dimethoate fall into “Extremely high” risk category and Imidaclopride falls into “Very high” risk category for groundwater contamination potential. Out of commonly used pesticides in Walawe area Carbofuran and 2,4D fall into Extremely high and Very high risk categories, respectively for groundwater mobility. The mobility risk of the selected pesticides for surface water of Kattakaduwa Wewa and Metigath Wewa is very low.

Applied pesticide on agricultural fields at the recommended rate (department of agriculture), were not found in wells which were located, 5-10 m away from the agricultural plots in Kalpitiya where Diazinon, Carbaryl, Methomyl, Imidacloprid, Fenthion, Captan, Carbofuran, Dimethoate, Chlorpyrifos and Oxyfluorfen are widely used and 1 to 3 m outside of the paddy fields in Walawe area where 2, 4 D, MCPA, Propanil, Diazinon, Carbofuran, Dimethoate, Chlorpyrifos, Oxyfluorfen and Fenthion are widely used. Residues of commonly used Pesticide were not detected in the reservoirs of Kattakaduwa Wewa, Metigath Wewa and Pathirana Wewa which are fed by either 100% drainage water or the reservoir of Habaralu Wewa, Kiri-ibban Wewa, Chandrika Wewa and Sooriya Wewa which are fed mainly by non-agricultural drainage. According to the field trials, when pesticides applied at the recommended rate and agricultural plots were irrigated at the average rate of 20mm/day, Dimethoate, Carbofuran, and Chlorpyrifos leached to 3m water table of Kalpitiya at 24±4 days, 25±3 days and 35±6 days after application of each pesticide respectively but Diazinon, Carbaryl, Methomyl, Imidacloprid, Fenthion, Captan, and Oxyfluorfen are not detected. The result from the case studies matched with the PIRI prediction, 100% for surface water and 74% for and groundwater.
