

I DEDICATE THIS THESIS TO MY PARENTS

DECLARATION

THE WORK DESCRIBED IN THIS THESIS WAS CARRIED OUT BY ME AT THE NATIONAL NARCOTICS LABORATORY ATTACHED TO THE NATIONAL DANGEROUS DRUGS CONTROL BOARD UNDER THE SUPERVISION OF PROF. A.M. ABEYSEKERA OF THE UNIVERSITY OF SRI JAYEWARDENAPURA AND DR. A.R.L. WIJESKERA OF THE NATIONAL DANGEROUS DRUGS CONTROL BOARD, AND A REPORT ON THIS HAS NOT BEEN SUBMITTED TO ANY UNIVERSITY FOR ANOTHER DEGREE.

03/07/2000

D.M.U.J. ABEYSINGHE

DATE

WE CERTIFY THAT THE ABOVE STATEMENT MADE BY THE CANDIDATE IS TRUE AND THAT THIS THESIS IS SUITABLE FOR SUBMISSION TO THE UNIVERSITY FOR THE PURPOSE OF EVALUATION.

Prof. A.M. Abeysekera

Dr. A.R.L. Wijesekera.

ACKNOWLEDGEMENTS

This project was undertaken in order to fulfil a requirement for the award of the Master of philosophy degree in chemistry of the University of Sri-Jayawardenepura, Nugegoda, Sri-Lanka.

For this purpose I was assigned to the Sri Jayawardenepura University by the National Dangerous Drugs Control Board of Sri Lanka, where I worked under the National Consultant of the National Narcotics Laboratory and Head of the Chemistry Department of the Sri Jayawardenepura University under whose joint direction this project was completed.

I take this opportunity to express my deep appreciation of the facilities granted to me by the late Professor Nandadasa Kodagoda and Prof. Diyanath Samarasinghe, in their capacities as Chairmen, National Dangerous Drugs Control Board of Sri Lanka, the latter of whom was responsible for referring me to Sri Jayawardenepura University to undertake this project. My sincere gratitude is due to both of them.

I must express my deep appreciation and gratitude to Dr. A.R.L. Wijesekera, National Consultant, National Dangerous Drug Control Board and Chairman, of the Sri Lanka Standards Institution and Professor A.M. Abysekera, Head of the Department of Chemistry, Faculty of Applied science, University of Sri Jayawardenepura under whose joint direction this project was undertaken for their valuable guidance, constructive criticism and assistance given to me to successfully complete this project.

I offer my sincere thanks to Mr. Y. Ratnayake (Executive Director, NDDCB), Mr. L. Jayasinghe (Director General, CEA) and Mrs. P.D.

Nanayakkara (Secretary to the Board, NDDCB) for their valuable assistance and encouragement.

A special word of thanks is due to Dr. A.M. Chandrasena of the Institute of Indigenous Medicine of University of Colombo, for providing me with the Ayurvedic drug Formulary and the research assistants Mr. S. Tennakoon and Mr. Nikawela of Department of Chemistry, University of Sri Jayawardenepura for their assistance.

I extend my sincere thanks to all members of the staff of my Laboratory and other departments of the NDDCB for the encouragement and assistance given to me all times during my project. Special mention must be made of the two laboratary technicians/assistants Mr. Ranjith Wickramasinghe and Ms. Renuka Perera and the typist/clerk Mrs. R.P.S.Colonne.

AYURVEDIC PREPARATIONS CONTAINING CANNABIS
- SOME ANALYTICAL ASPECTS OF PHARMACOLOGICAL AND LEGAL IMPORTANCE

DAUNDASEKARA MUDIYANSELAGE

UPUL JANAKA ABEYSINGHE

ABSTRACT

Ayurvedic preparations containing varying amounts of Cannabis are freely available in Sri Lanka. These narcotic preparations are being abused by youngsters including school children which poses a threat not only to their health but also to society. However current narcotics legislation in Sri Lanka does not cover these preparations. "Madana Modakaya" (MM) is the most popular preparation currently available.

The aim of this study was to develop a method to quantify the Δ^9 -Tetrahydrocannabinol (Δ^9 -THC) levels in MM, to use this method to analyse market samples and to study how the manufacturing process affected the final level of Δ^9 -THC in the product. It is hoped that this data will enable the authorities to legislate for permissible levels of Δ^9 -THC in MM, and that the method developed would be used as the official method of analysis.

A method to quantify Δ^9 -THC in MM was developed. The method which involved solvent extraction and column chromatography followed by GC, was validated by the standard addition recovery method. In the study of the methods for the preparation of MM, TLC densitometry was used

in quantifying Δ^9 -THC, Cannabidiol and Cannabinol. A laboratory sample prepared according to the Ayurvedic Pharmacopoeia was used as the standard preparation.

A field survey revealed that there were over 20 brands of MM in the market. The price and weight of a packet (single dose) varied from 3-5 rupees and 5.70 - 10.01 g respectively. The Δ^9 -THC content varied from 0.0183 % to 0.0747 % (w/w).

None of the samples of the 23 brands studied contained atropine, indicating that the popular belief that MM is adulterated with Datura seeds is not true.

The Ayurvedic Pharmacopoeia describes two methods for "detoxification" of Cannabis prior to incorporation in the drug. It was shown that one of the method, namely frying in ghee, resulted in the reduction of Δ^9 -THC approximately by 50 %.

Based on data obtained on the standard sample and data on the highest levels of Δ^9 -THC found in local Cannabis, a permissible maximum of 0.031 % (w/w) of Δ^9 -THC in MM is proposed.
